Introduction to (Bayesian) Estimation MAE 5020

Filtering and Smoothing: a Bayesian approach

Oklahoma State University

November 1, 2023

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

Overview

- Deviate from the textbook to present a systematic development of nonlinear filtering and smoothing
- Probabilitist models
- Generic filtering and smoothing equations
- Application to the basic state-variable model
- Reference: Bayesian filtering and smoothing, 2013, Cambridge University Press

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Depending on the relative relationship of total number of available measurements up to time step N and the time point k at which we estimate x(k)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- \blacktriangleright k > N: prediction
- \blacktriangleright k = N: filtering
- \blacktriangleright k < N: smoothing.

Notation: $\hat{x}(k|j)$, $x_k = x(k)$, $x_{1:k-1}$

Probabilistic state space model

We extend the basic state-variable model to a generic model given by a sequence of conditional probability distributions:

 $egin{aligned} & x_k \sim p(x_k | x_{k-1}) \ & z_k \sim p(z_k | x_k) \end{aligned}$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

where

Example: the basic state-variable model

What is the probabilistic state-space model?

$$\begin{aligned} x(k+1) &= \Phi(k+1,k)x(k) + \Gamma(k+1,k)w(k) + \Psi(k+1,k)u(k) \\ z(k) &= H(k)x(k) + v(k), \quad k = 0, 1, \cdots. \end{aligned}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Markov properties

The states x_k , $k = 0, 1, 2, \cdots$, form a Markov sequence, which satisfies

•
$$p(x_k|x_{1:k-1}, z_{1:k-1}) = p(x_k|x_{k-1})$$

•
$$p(x_{k-1}|x_{k:N}, z_{k:N}) = p(x_{k-1}|x_k).$$

Conditional independence of measurements:

$$p(z_k|x_{1:k}, z_{1:k-1}) = p(y_k|x_k).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Example: Gaussian random walk

$$egin{aligned} & x_{k+1} = x_k + w_k, \quad w_{k-1} \sim \mathcal{N}(0, Q), \ & z_k = x_k + v_k, \quad v_k \sim \mathcal{N}(0, R). \end{aligned}$$

Joint distribution, likelihood, and posterior

Joint prior distribuiton:

 $p(x_{0:N}) =$

Joint likelihood distribution

 $p(z_{1:N}|x_{0:N}) =$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Posterior distribution from Bayes' rule:

$$p(x_{0:N}|y_{1:N}) =$$

 \approx

Challenges in real time

- The number of computations per time step increases as new observations arrive.
- Develop recursive estimation steps to compute prediction, filtering, and smoothing distributions.
- Only a constant number of computations are done at each time step.
- Start with Bayesian filtering equations (which will include prediction)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Move to Bayesian smoothing equations

Generic Bayesian filtering equations

- Bayesian filtering: compute the marginal distribution p(x_k|y_{1:k}).
- Fundamental equations for recursive Bayesian filtering at time step k
 - lnitialization: start with the prior distribution $p(x_0)$
 - Prediction step: Chapman-Kolmogorov equation

$$p(x_k|z_{1:k-1}) = \int p(x_k|x_{k-1})p(x_{k-1}|z_{1:k-1})dx_{k-1}$$

Update step: via Bayes' rule

$$p(x_k|z_{1:k-1}, z_k) = \frac{p(z_k|x_k)p(x_k|z_{1:k-1})}{Z_k}$$

$$Z_k = \int p(z_k|x_k)p(x_k|z_{1:k-1})dx_k.$$

Graphically

◆□ ▶ < @ ▶ < E ▶ < E ▶ ○ E ● ○ Q @</p>

Proof

Joint distribution of x_k and x_{k-1} :

Marginalization of x_{k-1} yields:

Bayes rule for x_k given z_k and $z_{1:k-1}$, i.e., $z_{1:k}$:

Developing the Kalman filter

Closed-form solution to the Bayesian filtering equations for linear Gaussian dynamic and measurement models

$$\begin{aligned} x(k+1) &= \Phi(k+1,k)x(k) + \Gamma(k+1,k)w(k) + \Psi(k+1,k)u(k) \\ z(k) &= H(k)x(k) + v(k), \quad k = 0, 1, \cdots. \end{aligned}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

▶
$$v(k) \sim \mathcal{N}(0, R(k)), w(k) \sim \mathcal{N}(0, Q(k)), x(0) \sim \mathcal{N}(m_x(0), P_x(0)).$$

Probabilistic models

Two useful Lemmas

Lemma 1 Suppose $x \sim \mathcal{N}(m, P)$ and $y|x \sim \mathcal{N}(Hx + u, R)$, then the joint distribution of x, y and the marginal distribution of y are given by

$$\begin{pmatrix} x \\ y \end{pmatrix} \sim \mathcal{N}\left(\begin{pmatrix} m \\ Hm + u \end{pmatrix}, \begin{pmatrix} P & PH^T \\ HP & HPH^T + R \end{pmatrix} \right)$$

Lemma 2: conditional distribution Suppose

$$\begin{pmatrix} x \\ y \end{pmatrix} \sim \mathcal{N}\left(\begin{pmatrix} a \\ b \end{pmatrix}, \begin{pmatrix} A & C \\ C^T & B \end{pmatrix} \right).$$

Then,

$$x \sim \mathcal{N}(a, A), \quad y \sim \mathcal{N}(b, B)$$

 $x|y \sim \mathcal{N}(a + CB^{-1}(y - b), A - CB^{-1}C^{\mathsf{T}})$
 $y|x \sim \mathcal{N}(b + C^{\mathsf{T}}B^{-1}(x - a), B - C^{\mathsf{T}}A^{-1}C).$

The KF equations from the Bayesian filtering equation

Assume that $p(x_{k-1}|z_{1:k-1}) \sim \mathcal{N}(m_{k-1}, P_{k-1})$ *Prediction step*: Calculate $p(x_k|z_{1:k-1})$ from $p(x_k, x_{k-1}|z_{1:k-1}) = p(x_k|x_{k-1})p(x_{k-1}|z_{1:k-1})$

Update step: $p(x_k|z_{1:k}) \propto p(z_k|x_k)p(x_k|z_{1:k-1})$ calculated from $p(x_k, z_k|z_{1:k-1})$.

Final equations adapted to the basic state-variable model

$$\begin{aligned} x(k+1) &= \Phi(k+1,k)x(k) + \Gamma(k+1,k)w(k) + \Psi(k+1,k)u(k) \\ z(k) &= H(k)x(k) + v(k), \quad k = 0, 1, \cdots. \end{aligned}$$

Prediction:

$$\hat{x}(k+1|k) = \Phi(k+1,k)\hat{x}(k|k) + \Psi(k+1,k)u(k)$$
$$P(k+1|k) = \Phi(k+1,k)P(k|k)\Phi^{T}(k+1,k) + \Gamma(k+1,k)Q(k)\Gamma^{T}(k+1,k)$$

Update: $\tilde{z}(k) = z(k) - H(k)\hat{x}(k+1|k)$

 $\hat{x}(k+1|k+1) = \hat{x}(k+1|k) + K(k+1)\tilde{z}(k+1|k)$

 $K(k+1) = P(k+1|k)H^{T}(k+1)(H(k+1)P(k+1|k)H^{T}(k+1) + R(k+1))^{-1}$ P(k+1|k+1) = (I - K(k+1)H(k+1))P(k+1|k).

Comments

Example: Gaussian random walk

Bayesian smoothing: Fixed-interval

- Compute the marginal posterior distribution p(x_k|z_{1:N}), where N > k.
- Smoothing also uses future measurements: Fixed-interval smoothing cannot be implemented online.
- Other types of smoothing:
 - ► Fixed-point smoother: p(x_k|z_{1:j}), j = k + 1, ..., with a fixed k. In this case, we improve our estimate of a state at a particular time by using future measurements. It can be calculated online, but subject to a delay of (j k) steps.
 - fixed-lag smoother: p(x_k|x_{k:k+L}), k = 0, 1, ··· , with a fixed L (positive integer). It can be used online where a constant lag between measurements and state estimates is permissible, subject to L steps of delay.

Bayesian smoothing equations

Forward computation: obtain the filtering posterior state distributions, $p(x_k|z_{1:k})$, $k = 1, \dots, N$, via a filter.

Backward computation:

$$p(x_k|z_{1:N}) = p(x_k|z_{1:k}) \int \frac{p(x_{k+1}|x_k)p(x_{k+1}|z_{1:T})}{p(x_{k+1}|z_{1:k})} dx_{k+1}$$

Rauch-Tung-Striebel (RTS) smoother: Kalman smoother

$$\begin{aligned} x(k+1) &= \Phi(k+1,k)x(k) + \Gamma(k+1,k)w(k) + \Psi(k+1,k)u(k) \\ z(k) &= H(k)x(k) + v(k), \quad k = 0, 1, \cdots. \end{aligned}$$

- Closed-form smoother equations for linear Gaussian dynamic and measurement models
- Look for smoothed distributions $p(x_k|z_{1:T}) = \mathcal{N}(m_k^s, P_k^s)$.
- Consists of a forward pass and a backward pass
 - Forward pass: the Kalman filter
 - Backward pass: backward-running recursive predictor

RTS Smoother Algorithm adapted to the basic model

Forward pass: Perform the KF to obtain $\hat{x}(k|k)$, $\hat{x}(k|k-1)$, P(k|k-1), and P(k|k), $k = 1, \dots, N$. Backward pass: for $k = N - 1, N - 2, \dots, 0$ as

$$\begin{aligned} x(k|N) &= \hat{x}(k|k) + A(k)[\hat{x}(k+1|N) - \hat{x}(k+1|k)] \\ A(k) &= P(k|k) \Phi^{T}(k+1,k) P^{-1}(k+1|k) \\ P(k|N) &= P(k|k) + A(k)[P(k+1|N) - P(k+1|k)] A^{T}(k). \end{aligned}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

 $\blacktriangleright P(k|N)$:

Availability of x̂(k|k), A(k), x̂(k + 1|N), x̂(k + 1|k), P(k + 1|N), P(k|k), P(k + 1|k):

Example

Nonlinear filters and smoothers

- Practical applications involve nonlinear dynamic and measurement models.
- Posterior distributions are no longer Gaussian even if the added noise is Gaussian.
- A large class of nonlinear filters aim at approximating the posterior distributions as Gaussian distributions
 - Extended Kalman filter (EKF)
 - Unscented Kalman filter (UKF)
 - Gaussian filter, ...
- Another type of popular nonlinear filters is Particle filters (PF), using a similar concept to MCMC.
- For each nonlinear filter, there is a corresponding nonlinear smoother, e.g., EKS, Particle smoother.

Taylor series expansion in linearization

Consider $x \sim \mathcal{N}(m, P)$ and y = g(x).

- ▶ $p(y) = |J(y)|\mathcal{N}(g^{-1}(y)|m, P)$, where J(y) is the Jacobian matrix of the inverse transform $g^{-1}(y)$.
- Except linear g, p(y) is difficult to obtain and handle.

First-order Taylor series expansion (linearization):

• Let
$$x = m + \delta x$$
, where $\delta x \sim \mathcal{N}(0, P)$.

$$g(x) = g(m + \delta x) \approx g(m) + G_x(m)\delta x + H.O.T.$$

 $G_x(m)$ is the Jacobian matrix of g(x) evaluated at x = m.

Expectation, covariance, joint distribution with linearization

・ロト・日本・モト・モー ショー もくら

A General Case: Mean, covariance, joint distribution

$$x \sim \mathcal{N}(m, P), w \sim \mathcal{N}(0, Q), y = g(x, q)$$

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

Extended Kalman filter

- Key idea: linearization, assume Gaussian distributions for posterior
- Generic model:

$$egin{aligned} & x_k = f(x_{k-1}, u_{k-1}, w_{k-1}), \quad w_{k-1} \sim \mathcal{N}(0, Q_{k-1}) \ & z_k = h(x_k, v_k), \qquad v_k \sim \mathcal{N}(0, R_k). \end{aligned}$$

• Linearization

$$f(x_{k-1}, u_{k-1}, w_{k-1}) \approx f(m_{k-1}, u_{k-1}, 0) + F_{x,k} \delta x_{k-1} + F_{w,k} w_{k-1}$$
$$h(x_k, v_k) \approx h(m_k, 0) + H_{x,k} \delta x_k + H_{v,k} v(k)$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Update:

Comments

Advantage of EKF: simplicity compared to its performance.

- Disadvantages of EKF:
 - Local linear approximation may not be sufficient for considerable nonlinearity.
 - Also not applicable to non-Gaussian distributions.
 - Requires differentiable dynamics and measurement models.

- Computation of Jacobian matrices can be error prone.
- Despite all these disadvantages, its simplicity makes EKF a first try and a common engineering approach to nonlinear filtering.

Example

<ロト < 個 ト < 臣 ト < 臣 ト 三 の < @</p>

Unify various Gaussian approximations to nonlinear transforms: approximate computation of the expectation

$$E_x[g(x)] = \int g(x)\mathcal{N}(x|m,P)dx.$$

If we can compute the above integral, we can then match the first/second order moments of the Gaussian approximation of (x, y) to the true moments.
